Python File Open

Next >

Open a File on the Server

Asume we have the following file, located in the same folder as Python:

```
demofile.txt

Hello! Welcome to demofile.txt

This file is for testing purposes.

Good Luck!
```

To open the file, use the built-in open() function.

The open() function returns a file object, which has a read() method for reading the content of the file:

```
f = open("demofile.txt", "r")
print(f.read())

Run example »
```

Read Only Parts of the File

By default the read() method returns the whole text, but you can also specify how
many character you want to return:

Example Return the 5 first characters of the file: f = open("demofile.txt", "r") print(f.read(5)) Run example »

Read Lines

You can return one line by using the readline() method:

```
Example
Read one line of the file:

f = open("demofile.txt", "r")
print(f.readline())
Run example »
```

By calling readline() two times, you can read the two first lines:

```
Example
Read two lines of the file:

f = open("demofile.txt", "r")
print(f.readline())
print(f.readline())
Run example >
```

By looping through the lines of the file, you can read the whole file, line by line:

Example

Loop through the file line by line:

```
f = open("demofile.txt", "r")
for x in f:
  print(x)
```

Run example »
